Pig producer ready for environmental management - gives the chance to optimize light, heat and water

It will soon be a legal requirement for all IE farms to introduce an environmental management system Pig producer Michael Brændgaard Rømer has chosen to see it less as a requirement, but more as an opportunity to optimize production.

company's environmental management to pig producer Michael Brændgaard Rømer at home at the kitchen table.

"It's simply something that we have to get a handle on. When the inspection comes in February, you might be

able to talk your way out of it at the start, but if you make a foot mistake, it will take even more time to correct the rear end," says Michael Brændgaard Rømer in a press release from LandboNord.

**SET THE ENVIRONMENT IN SYSTEM** There are 1,065 yearling sows on the farm, which together produce 37,000 seven kilo pigs.

In addition to feed costs, it also requires energy in the form of light, heat and water to keep production running,

and here it can be advantageous to take a closer look at environmental management in relation to

"The individual farmer works continuously to optimize his production, but with environmental management we put things into a system. That way we can start benchmarking environmental parameters, which

we don't normally do. This is where it can become interesting to dive down to data", says Nina Roland Simonsen.

In addition to focusing on reducing energy consumption, environmental management also focuses on saving resources, lowering the risk of environmental accidents, and looking at the impact of daily operations on the environment.

A large number of points that are not only important for the environment, but to a great extent also for

the farmer's finances and the well-being of the employees.

slurry container is covered", says Michael Brændgaard Rømer.

"It motivates me to be able to follow how we are in relation to others. If we are above the average in terms of consumption, then we have to dive in and see if it can be changed.

**ENVIRONMENTAL MANAGEMENT ON MULTIPLE LEVELS** Therefore, he will now use the calculations and key figures from environmental management

actively in the budgeting for the coming years. "It makes a lot of sense to have a written plan for what I intend to do going forward instead of having to deal with

things as they happen. It can be really good to have a strategy in relation to the municipality, but also in relation to the bank", says Michael Brændgaard Rømer.

of production to find possible energy savings and environmentally sound solutions.

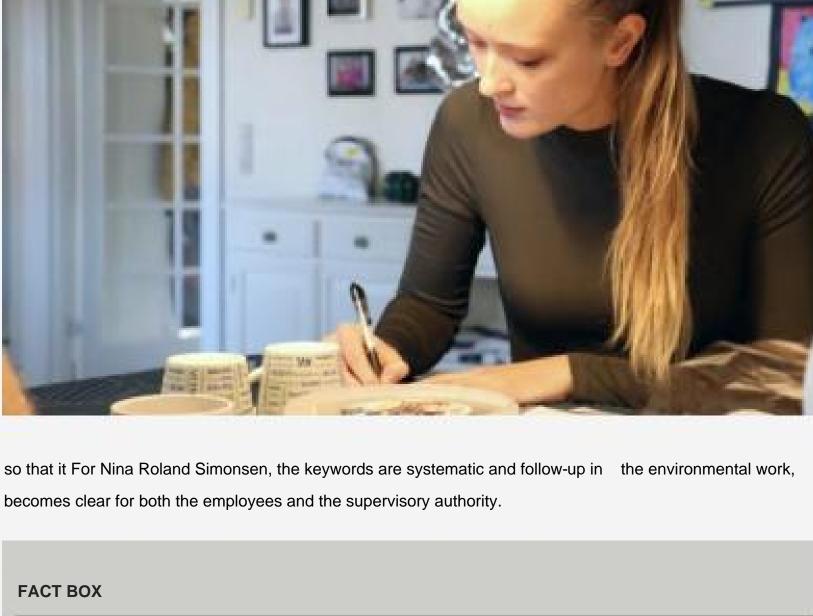

Regardless of how actively you want to use your environmental management in the company, LandboNord's version is composed in such a way that it is as tangible and usable in everyday life as possible. According to Nina Roland Simonsen, there is a lot of low-hanging fruit out there to pick.

"What at first glance may seem like even more bureaucracy can turn out to be an advantage on the bottom line. The key words are systematics and follow-up in the environmental work, so that it becomes clear for both the employees and the control authority.

This means that agriculture's environmental policy must be spelled out and a series of environmental targets

must be established with an associated action plan for meeting the targets. Once a year, the overall

environmental work must then be adjusted and evaluated", says Nina Roland Simonsen.

All IE farms must have an environmental management system in place by 21 February 2021. An IE livestock farm
