

In need of light and heat

RN Solutions, who is owned by Rune Qvist Nielsen and Niels Christian Zinck, highlights LED light and the heater “Aniheater” on NutriFair 2017.

We know that the right light has a great influence on the production, says Rune Qvist Nielsen.

- Most of the Danish pig producers know, that there must be a great amount of light in the mating and control section. However, most sows are stabled in dark stables, which leads to poor reproduction, sow's which are not pregnant, abortions and empty sows.

According to Rune Qvist Nielsen the Danish Knowledge Center for Pig Production recommends, that there is at least 100 lux by the head of the sow 16 hours per day.

Most of the advisors and veterinarians recommends at least 100 lux and better 200 lux 17 hours per day. Furthermore, there is

more and more international studies, that recommends at least 200 lux.

- The only problem is that it is extremely difficult to get this much light down by the head of the sow, he says and emphasizes the LED luminaires from RN Solutions.

No need for an Electrician

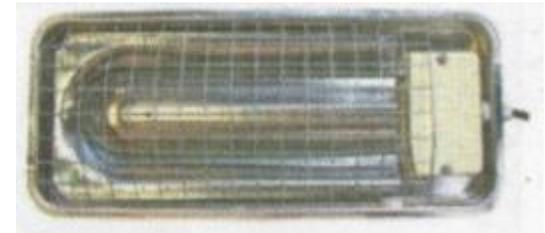

The luminaires are connected by series and the installation/mounting can be done by the farmer themselves.

Is a smaller fixture wanted, Rune Nielsen highlights the Easy Light, which can be used in the piglets caves or in the corridors, where the need of powerful light is lower.

- With that you get a cheaper fixture, which doesn't require much space and gives a less powerful light.

Rune Qvist Nielsen owner and founder of the Company RN Solutions, looks at NutriFair as a good little fair, where the right people come.

Aniheater can be high pressure washed and with that, it makes it easier for the farmer and he does not have to take it down to clean.

Aniheater can be high pressure washed

The heater is used in the piglets caves and gives, according to Rune Qvist Nielsen, a better heat distribution compared to other heaters in the market. With this better heat distribution, we experience a higher welfare for the piglets, he says.

This heater is special because it can be washed, so you do not have to take it down to clean it.

- The Aniheater can be washed with high pressure, notes Rune Qvist Nielsen.
